GitHub: github.com/PRIMCODIN · github.com/vpr0011-ops

Second-year Multiplatform App Development (DAM) student who builds software end-to-end: backend, AI orchestration and API integration. I design scalable data architectures, deploy services with Docker, and connect LLMs to real applications through n8n and Dify. I took an AI conversational assistant from architecture to deployment in a 6-person team, and maintain a portfolio of full-stack personal projects, one of them deployed and playable in production. Focused on backend, applied AI and DevOps.

Internship & Highlighted Projects

AI conversational assistant embedded in a mobile app — DAM Internship

March – July 2026 · 6-person team · Role: backend, orchestration & infrastructure · [Repo](#)

- Designed and built the **n8n** and **Dify** workflows connecting the Flutter app to the AI services, defining the end-to-end data contract.
- Built a scoped agent using **system prompts** and **RAG**, keeping it within the defined scope and reducing out-of-domain responses.
- Integrated **Google Calendar via OAuth** (Google Cloud Console) for reading and creating events in real testing.
- Set up a centralized local server so all 6 members could test the same flow, freeing up laptop RAM and unifying the test environment.
- Designed the data architecture and workflow error handling to make what the app sends and receives scalable.
- Collaborated on UI and on team Git work: branches, merges and pushes.

Stack: Flutter · n8n · Dify · Groq · Google Calendar OAuth · Docker

Banking system — Client app + Admin panel + AI chatbot (personal project)

2026 · [Repo](#)

- Two native Android apps (**Kotlin + Jetpack Compose**) sharing a single database: an admin panel (“god mode”) and a client app, modeling the real privilege isolation of a banking system.
- Client features: peer-to-peer **Bizum transfers** and transaction history, with networking via Ktor Client and supabase-kt.
- Integrated financial chatbot: natural-language queries over the user’s own data (highest expense, average, monthly categories) resolved by an AI agent **orchestrated in n8n** and exposed via webhook, decoupled from the app.
- Data modeling in **Supabase** with **Row Level Security** and role/permission management over sensitive data; credentials kept out of source (BuildConfig).

Stack: Kotlin · Jetpack Compose · Supabase (PostgreSQL, RLS) · n8n · Groq · Ktor · Docker

Flag Challenge — flag quiz web game (personal project, in production)

2026 · [Repo](#) · [Live demo](#)

- SPA web game **deployed and playable** on Vercel: flag quiz with three modes (Classic, Free Mode by continent/difficulty, and World Path level progression) and time-based scoring.
- Supabase backend: profile and leaderboard tables, **RLS** policies for secure client access (including guest mode) and a **real-time leaderboard with Realtime**.
- Frontend in **React + Vite** with React Router, persistent session, protected routes and a profile with personal stats.
- Custom visual identity, mobile-first responsive design and secure environment-variable management.

Stack: React · Vite · Supabase (PostgreSQL, Auth, RLS, Realtime) · React Router · Vercel

Fitness & nutrition app (personal project, in development)

2026 · [Repo](#)

- Mobile app for calorie and workout tracking with a **professional architecture**: Clean Architecture and Riverpod state management in Dart/Flutter.
- Supabase backend with RLS and planned AI orchestration via n8n: calorie estimation from meal photos and workout-routine personalization.
- AI-assisted workflow with **Claude Code**: detailed specs and skills to keep a consistent, documented architecture (app/db/infra/specs folders).

Stack: Flutter · Dart · Riverpod · Clean Architecture · Supabase (RLS) · n8n · Claude Code · Docker

Telegram bot: voice-based appointment scheduling (personal project)

2026 · [Repo](#)

- Full **audio** → **appointment** pipeline: a Telegram bot connected to Make.com that listens to messages and downloads the received audio.
- A **Dify** flow transcribes the audio and, via system prompts, structures the data (title, date, time) to fill the Google Calendar event.
- Automatic event creation in **Google Calendar (OAuth)** and confirmation to the user through the bot. Flow files sanitized (no credentials) and re-importable.

Stack: Telegram Bot API · Make.com · Dify (transcription + AI, Gemini) · Google Calendar API OAuth

Work Experience

Technical Support Operator — Securitas Direct, S.L. *June 2024 – September 2025*

- Remote fault diagnosis and remote maintenance of systems; phone support and resolution of technical incidents.
- Management of alerts, authorizations and logging in internal systems.

Croupier — Casino de Barcelona (Grup Peralada) *March 2022 – March 2023*

- Precise handling of chips, payouts and collections in demanding environments; customer service under pressure.

Education

Advanced VET in Multiplatform App Development (DAM) — Davante MEDAC *In progress (2nd year)*

Technological Baccalaureate — IES de Sales *2016 – 2020*

Technical Skills

Languages: Dart (Flutter), Kotlin, Python, C#, SQL, NoSQL, JavaScript, HTML/CSS.

AI / Automation: n8n, Dify, Make.com, system prompts, RAG, LLM agent orchestration and API integration.

Backend / Infra: Supabase, PostgreSQL, MongoDB, Docker, Google Cloud Console, OAuth, data architecture, RLS.

Architecture: Clean Architecture, Riverpod (state management), Jetpack Compose.

Tools: Git & GitHub, Claude Code (AI-assisted development with skills and specs), Vercel, Vite.

Languages & Other

Languages: Spanish & Catalan (native). English (advanced).

Other: Forklift license. Food handler certificate.
